Project	Restaurant & Review Analytics — Task 1
Prepared for	Alfido Tech (data internship)
Dataset	Kaggle: bhanupratapbiswas/zomato (Bangalore)
Scope	51,717 listings · 12,494 unique venues · Bengaluru
Date	26 June 2026

1. Executive Summary

This report analyses **51,717 Zomato listings** covering **12,494 unique restaurants** across Bengaluru. After repairing a corrupted export, cleaning rating/cost text fields, and de-duplicating venues, we examined how **cuisine, neighbourhood, price, and service options** relate to customer ratings.

Headline findings:

- **25.5%** of venues are unrated (incl. 2,208 “NEW” restaurants). Among rated venues the mean is **3.63/5** — a generally positive but tightly-clustered distribution.
- Restaurants concentrate in tech-corridor neighbourhoods — **Whitefield**, Electronic City and BTM lead. Supply tracks Bengaluru's IT geography.
- **North Indian** is the most common cuisine, but the highest-rated categories are **Asian** (4.11), American and Continental — popularity and quality diverge.
- **Table booking** is the single strongest rating signal: venues that accept bookings average **4.12** vs **3.57** without. Fine Dining venues top the rating table (4.14).
- Price barely moves rating until the very top: budget-to-premium bands sit near **3.55**, rising to **3.79** only at the luxury tier. **Votes** remain the strongest numeric correlate of rating ($r = 0.399$).

These patterns drive five recommendations for an Alfido-Tech-style discovery platform (Section 8): close the unrated gap, push table-booking/quality signals, and exploit cuisine and neighbourhood whitespace.

2. Data Cleaning & Methodology

The raw file held 13 columns but ~8% of rows were corrupted by un-escaped newlines in text fields (review fragments bleeding into the rating column). The pipeline:

- **Integrity repair** — rows whose *online_order/book_table* were not strictly Yes/No were flagged as corrupted and dropped (4,535 rows), recovering the canonical 51,717-row dataset.
- **Ratings** — parsed “4.1/5” / “3.9 /5” to a numeric 0–5 score; “NEW”, “-” and blanks treated as *unrated*.
- **Cost** — thousands separators stripped and cast to numeric. All venues are in Bengaluru, so prices are already a single currency (INR) — *no currency conversion required*.
- **Text fields** — cuisines and rest-type split into a primary value plus a count; *dish_liked* mined for the most-liked-dishes wordcloud.
- **De-duplication** — each venue is listed once per service type; a unique-restaurant view (name + address) underpins restaurant-level statistics to avoid double counting.

Metric	Value
Raw rows	56,252
Corrupted rows dropped	4,535
Clean listings	51,717
Unique restaurants	12,494
Rated share	80.6%
Rating ~ Votes correlation	0.399
Rating ~ Cost correlation	0.327

3. Ratings Landscape

Among rated restaurants, scores cluster tightly in the **3.5–4.0** band (mean **3.63**); very few fall below 3.0 or exceed 4.5. The platform's challenge is less about poor ratings and more about the **25.5%** of venues that carry no rating at all — including new restaurants yet to gain reviews.

Figure 1 — Distribution of ratings (rated restaurants).

4. Location Hotspots

Restaurant supply maps onto Bengaluru's tech geography: **Whitefield**, Electronic City, BTM, HSR and Marathahalli — all major IT-corridor residential belts — hold the most venues. Central hubs like Indiranagar and Koramangala follow. Thinner neighbourhoods represent expansion headroom.

Figure 2 — Top Bangalore neighbourhoods by unique-restaurant count.

Figure 5 — Highest-rated cuisines (min. 40 restaurants).

6. Price, Service & What Drives Ratings

Price is a weak lever until the very top. Budget, mid and premium cost bands all rate near **3.55–3.56**; only the luxury band lifts to **3.79** (rating–cost $r = 0.327$). Spending more does not reliably buy a better-rated experience except at the premium end.

Figure 6 — Cost for two vs rating (means by cost band).

Service options matter more than price. Table-booking venues average **4.12** versus **3.57** without — a large gap reflecting sit-down, experience-led dining. Online ordering shows a smaller positive lift (3.65 vs 3.59).

Figure 7 — Average rating by online ordering and table booking.

Figure 8 — Highest-rated restaurant types (min. 40 venues).

The correlation heatmap confirms the hierarchy: **votes** is the strongest numeric correlate of rating ($r = 0.399$), ahead of cost. Engagement, not price, most tracks perceived quality — a visibility flywheel.

Figure 9 — Correlation heatmap of numeric features.

Figure 10 — Votes vs rating (engagement is the strongest signal).

Listings skew heavily toward **Delivery** and **Dine-out**, with Desserts, Cafes and nightlife forming a long tail. The platform is, first and foremost, a delivery marketplace.

8. Five Recommendations for the Platform

Actionable moves for an Alfido-Tech-style restaurant-discovery platform, grounded in the findings above:

1. Close the “unrated” gap with a review-activation programme

With 25.5% of venues unrated (incl. 2,208 NEW listings), launch one-tap ratings, post-order prompts and a “new on Zomato” boost so fresh restaurants accrue reviews fast. Since votes are the strongest rating signal, more reviews directly improve discoverability and trust.

2. Make table-booking a first-class, promoted feature

Booking-enabled venues rate far higher (4.12 vs 3.57). Push booking onboarding for dine-out and Fine Dining/Pub/Lounge venues, and surface a “Reserve a table” filter — it correlates with the best-rated experiences on the platform.

3. Feature high-rated, under-supplied cuisines

Quality and volume diverge: Asian, American and Continental rate highest yet are under-represented versus North Indian. Run curated collections and partner onboarding for these whitespace cuisines to differentiate discovery.

4. Build dish-led and neighbourhood content

The most-liked dishes (Pasta, Burgers, Biryani, Cocktails) are concrete content hooks. Pair “best biryani near you”-style guides with neighbourhood spotlights for hotspots like Whitefield and Indiranagar to drive engagement-led ratings.

5. Expand methodically beyond the tech-corridor core

Supply concentrates in IT-belt neighbourhoods. Use that dense-market playbook — referral incentives for the first wave of restaurants and reviewers — to grow thinner localities and balance the geographic footprint.

Bottom line: the platform's biggest levers are *engagement and service signals* — activate reviews, promote table-booking and quality cues, and surface high-rated cuisine and neighbourhood whitespace — far more than price alone.
